Presentation Roadmap

What the deck explains about the software project and GitHub repository.

Deck goal

Explain the project in a simple academic format: what it does, how the modules connect, and how GitHub supports sharing and maintaining the code.

Project Overview

A desktop-style system for organizing library records and circulation activity.

- **Purpose**

Replace manual book registers with a structured digital workflow for library staff.

- **Core users**

Librarians or administrators who add books, maintain member records, and issue/return books.

- **Main value**

Centralizes availability, member information, and transaction status in one interface.

Functional scope

Dashboard

Book Management

Member Management

Issue & Return

Repository Structure

Visible files show a practical project layout with code, database, UI, and documentation.

main.py	Likely application entry point.
database.py / database	Database connection or stored data layer.
models.py	Data structures for books, members, and transactions.
ui	User interface modules/screens.
README.md / DOCUMENTATION.md	Project explanation and usage notes.
CONTRIBUTING.md / LICENSE	Collaboration rules and MIT license.
flowchart.png	Visual process or architecture reference.

Dashboard Module

The dashboard summarizes the current state of the library at a glance.

Recent Transactions table helps staff confirm issue/return activity without opening another screen.

Book Management Module

Books can be added, updated, deleted, searched, and tracked for availability.

- Record fields**
Title, author, category, quantity, and available count.
- CRUD actions**
Add, update, delete, and clear actions are visible in the form panel.
- Search area**
The table layout supports scanning and filtering book records.

Member Management Module

The member page stores reader identity and contact information.

- Member details**
Full name, phone number, and email are captured through a simple form.
- Operational use**
The issue/return module can connect each transaction to a real member.
- Data quality**
Phone and email validation would strengthen reliability in future versions.

Issue & Return Workflow

The circulation workflow connects a selected book, selected member, issue date, and return status.

Select Book

Choose available title.

Select Member

Choose borrower.

Issue

Create transaction.

Return

Mark status returned.

Active Issues and All Transactions tabs separate current loans from full transaction history.

Data Model Concept

The visible screens imply three central entities and one database layer.

Application Architecture

A simple layered explanation for presenting how the system is organized.

User Interface

Dashboard, Books, Members, Issue/Return screens

Application Logic

Validation, CRUD operations, issue and return rules

Data Access

database.py and model classes coordinate storage

Documentation

README, documentation, license, contributing guide

GitHub Workflow Explained

How the repository page helps reviewers understand and access the project.

- **Code tab**
Shows folders, source files, documentation files, and latest visible commit message.
- **Main branch**
The visible default branch contains the current working version of the project.
- **Commits**
Commit history records changes over time; the screenshot shows 4 commits.
- **License and docs**
MIT license, README, documentation, and contributing files improve project clarity.

Strengths and Learning Outcomes

The project demonstrates both software functionality and basic professional repository practice.

Functional completeness

The app covers the main library circulation tasks: books, members, issue, return, and dashboard status.

Readable interface

Navigation is clear, tables are structured, and forms map directly to the data users need.

Version control evidence

GitHub stores the code and visible commit history so changes can be reviewed.

Documentation habit

README, documentation, license, and contributing files make the project easier to understand.

Future Improvements

Ideas that can make the project stronger after the current version.

Login roles for admin and staff

Due dates, overdue tracking, and fines

Advanced search and category filters

Reports for popular books and monthly issues

Input validation and error messages

Automated tests and clearer setup instructions

Conclusion

The Library Management System is a practical Python project that manages books, members, and circulation transactions. The GitHub repository provides the code base, documentation files, license, and commit history needed for review and sharing.
